

BeAvis Car Rental System

You have been hired by a car rental company, BeAvis, to create a software system to replace their pen-and-paper rental process. The intention of this software system is for conducting and managing a car rental company. It will encapsulate various functions that are essential for day-to-day management of the company.

The car rental software system can be accessed through two different methods: mobile application and website.

The mobile application must be compatible with the latest version of either iOS or Android. The website version of the system will require the same necessities as the app in terms of credentials for a user to rent a car. The website design may differ compared to the app, but should still be intuitive to navigate. In either instance of the system, the user should be prompted to enable location/GPS services, which will allow users to view locations close to them, as well as give directions should they request a rental.

Users will need to create an account if they do not already have an existing one. Users must enter valid information into each data field (email, password, etc.) to complete their account creation. A verification code will be sent to their email to finalize the processes, allowing them to finalize the process. Two-step authentication is not enabled by default, but should be allowable through the app's settings, which can link with an authenticator app.

Users will have options regarding the rental process (make a rental, view rental history, lookup locations) as well as the previously mentioned settings, where users can link a payment method to their account for purchases. Payment information should be stored securely and kept separate from other information that the system may store to minimize chances of a privacy breach.

The system must also facilitate the distribution and signing of rental agreement contracts. These should be kept under secure conditions, since it will include customer signatures.

Employees of the company should also be able to log into the system. Employees should be able to pull up customers to review their rental status and contracts, check the fleet of cars currently available for rental, and update status of cars if any need to be removed for maintenance.
